# Next!

# Theres a LOT going on with Next

Many topics and ideas that are all connected

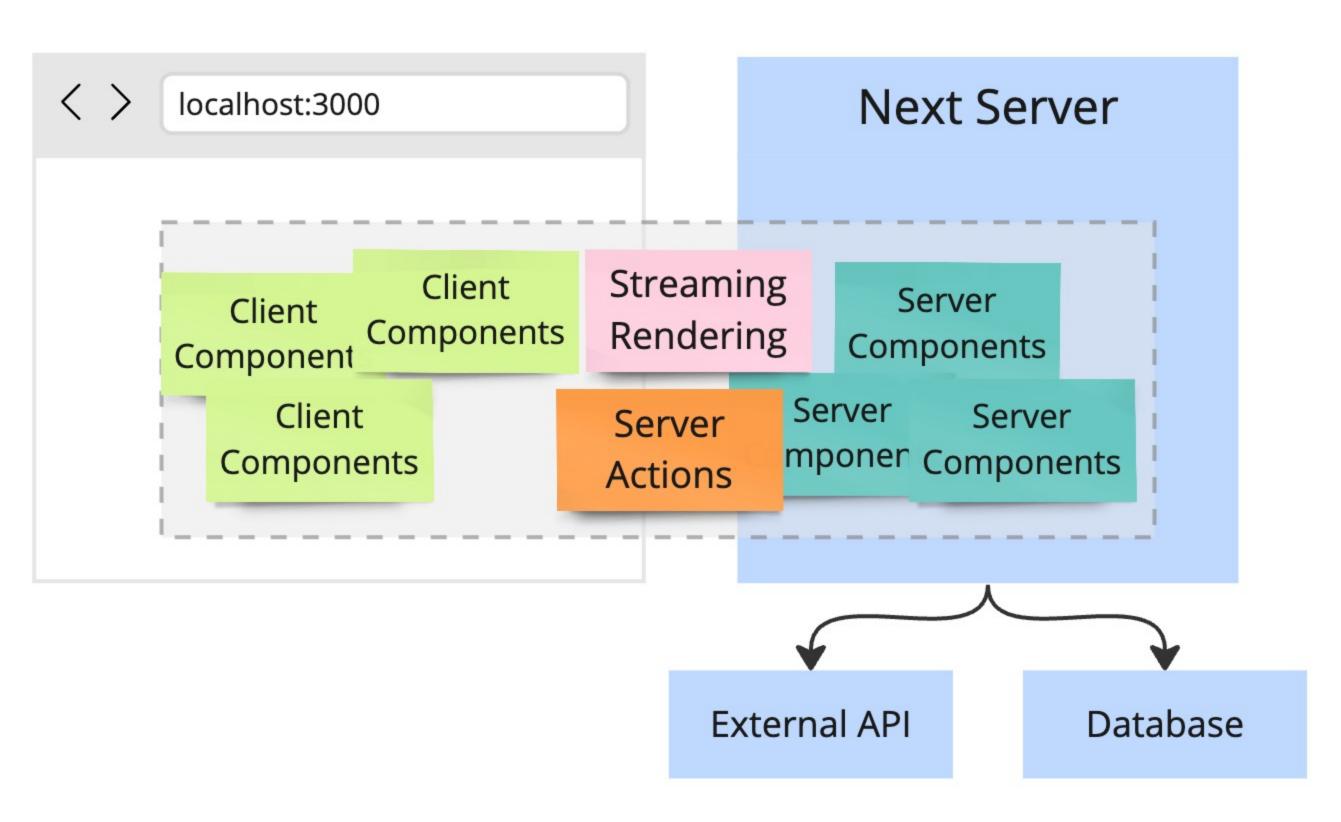

### Traditional React App

All JS running in the browser

(Relatively) mature state management with Context, Redux, etc

Your app behaves (relatively) the same in dev and production

Usually, React used when we need a dynamic app - lots of stuff to click on, lots of data fetching

JS split between browser and server - need to keep track of where our code is running

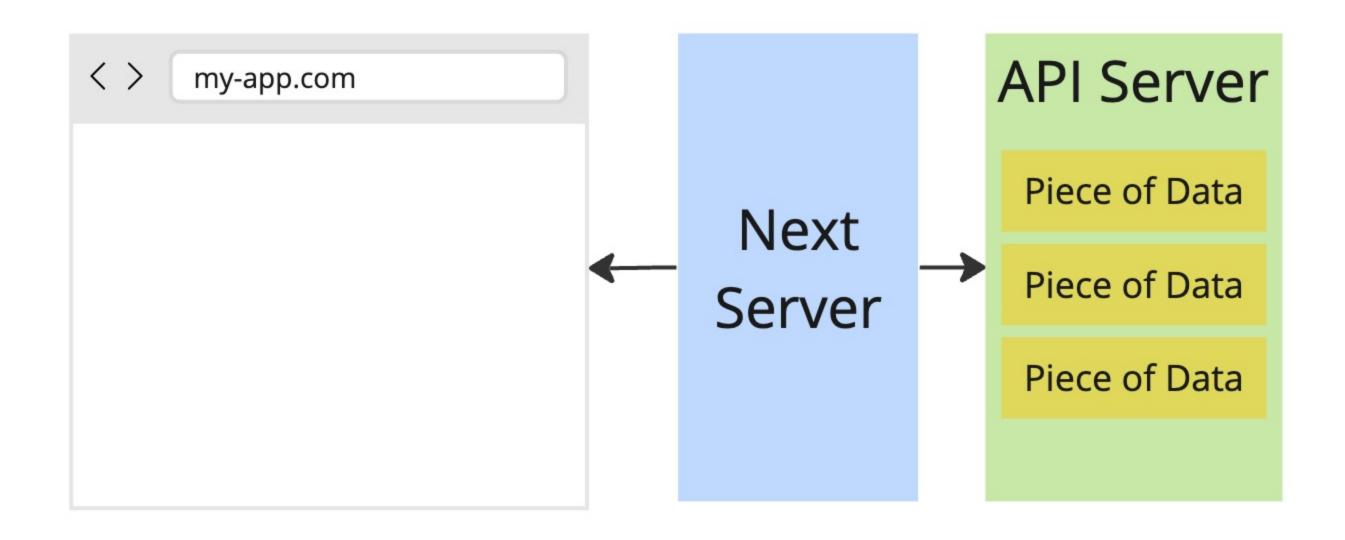

New React features! New kinds of components

New ways to manage state

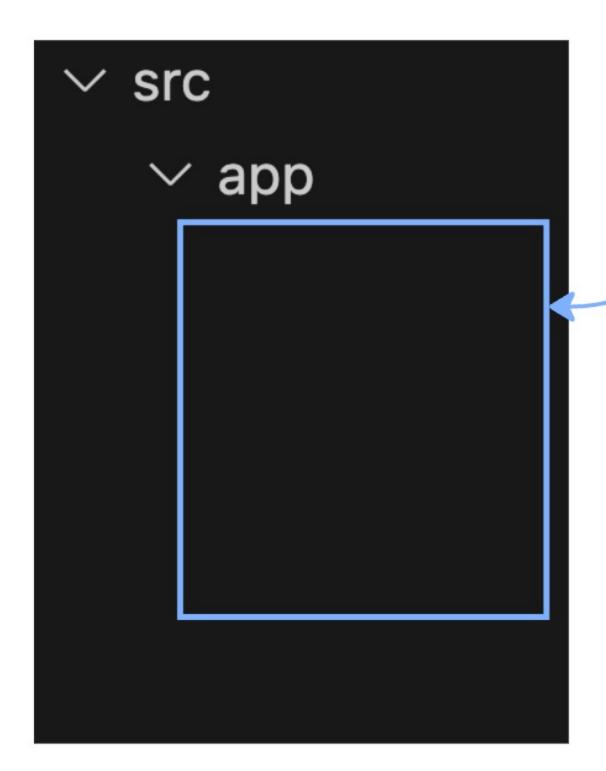

App behaves can behave *very* very differently between dev and production

#### First App

Super simple - fetch data from an API and show it on the screen

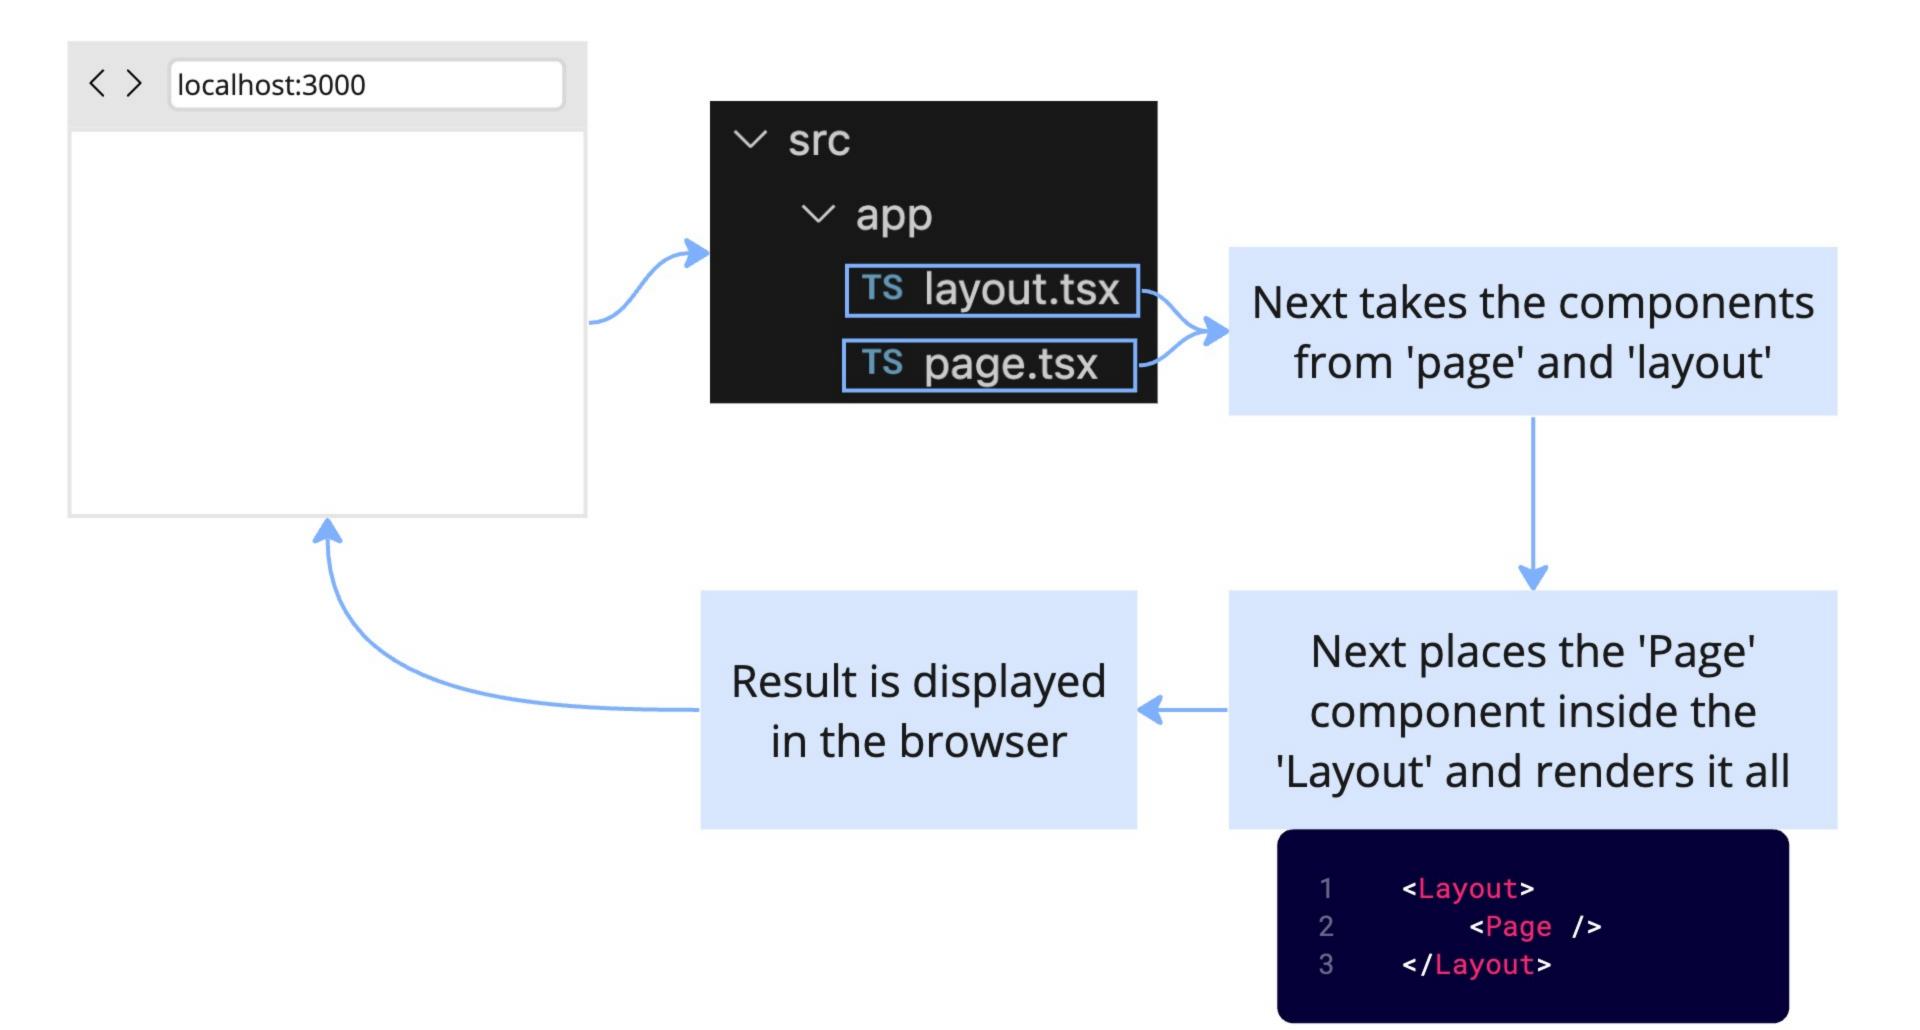

## npx create-next-app@latest

The 'src/app' folder is super special

The files and folders we create in here define the different routes that we can visit

Next finds all the files called specifiaclly 'page.tsx' in the app folder

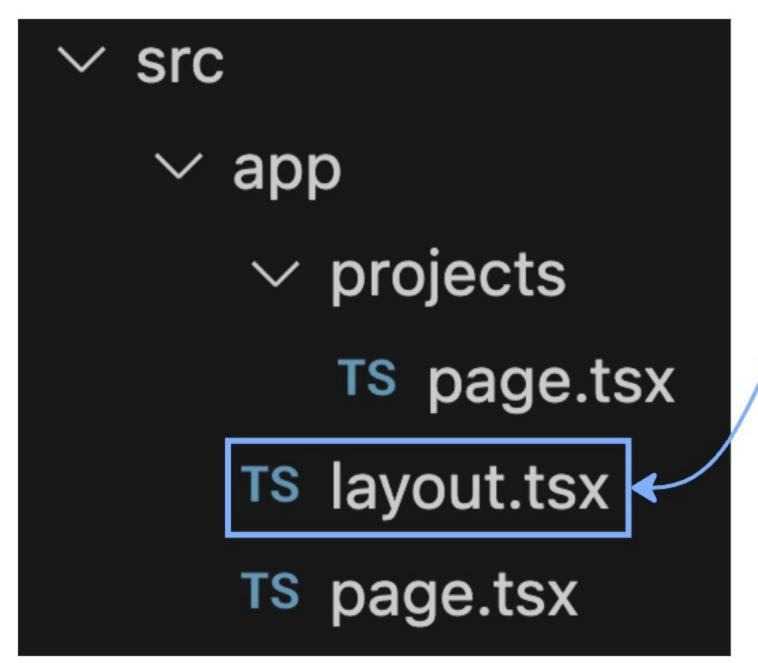

Each one defines a new route that the user can visit

The folders that the 'page.tsx' file is nested in defines the route

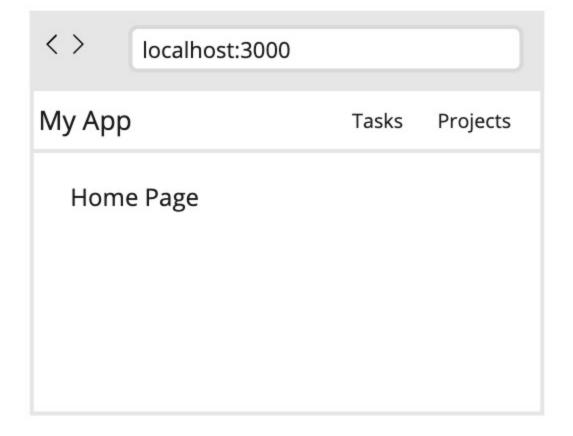

Displayed when the user goes to localhost:3000/projects

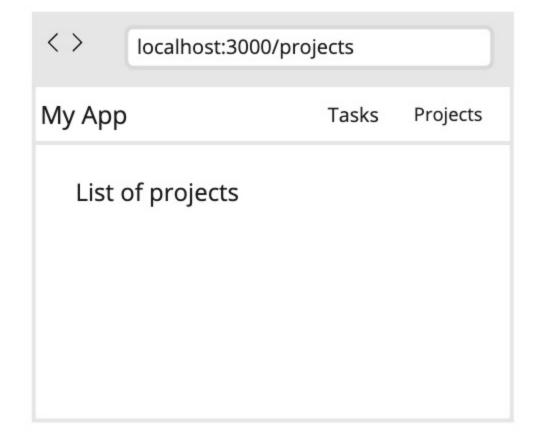

Displayed when the user goes to localhost:3000

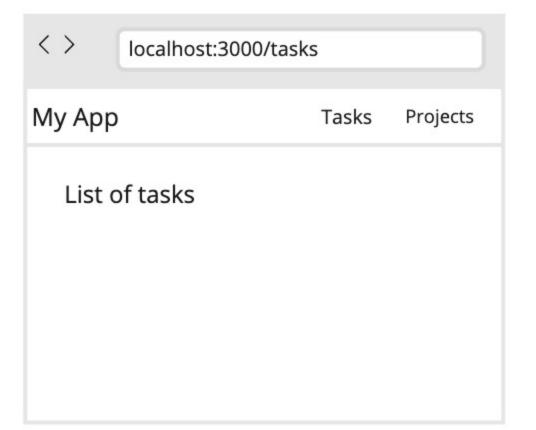

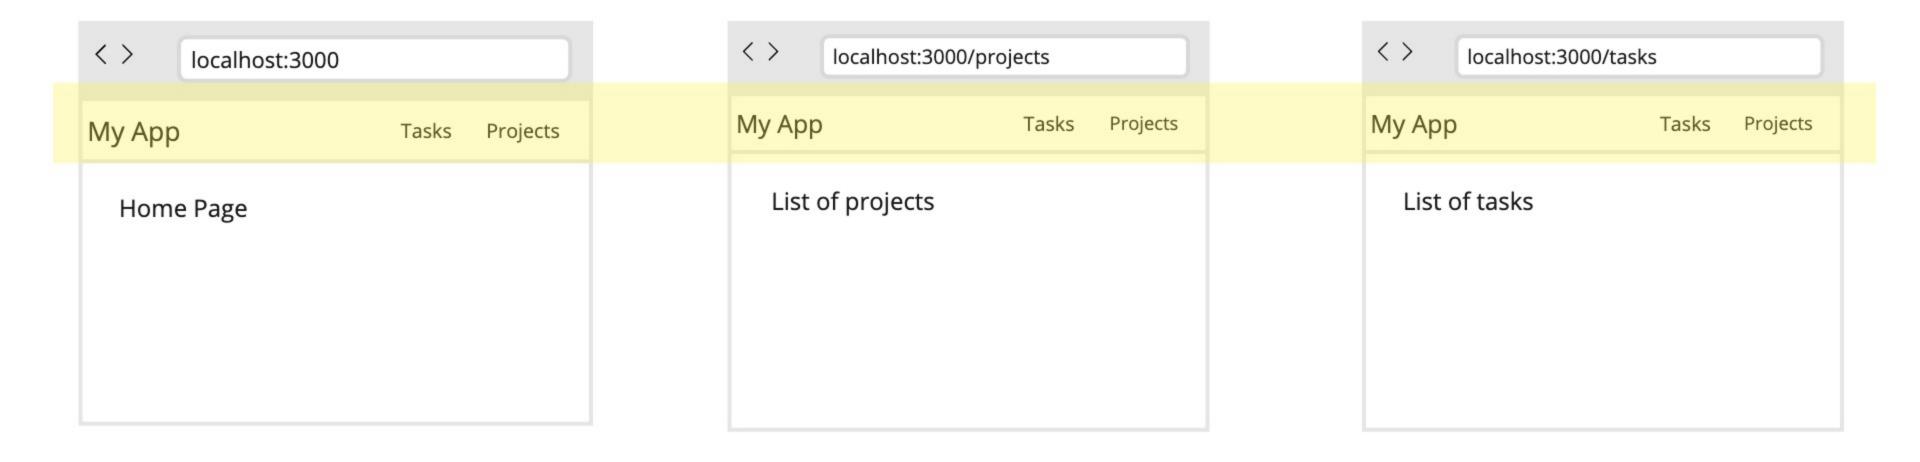

When Next has decided which page.tsx file to show, it is displayed in the **layout.tsx** file

The **layout.tsx** file is used to display elements common to many pages

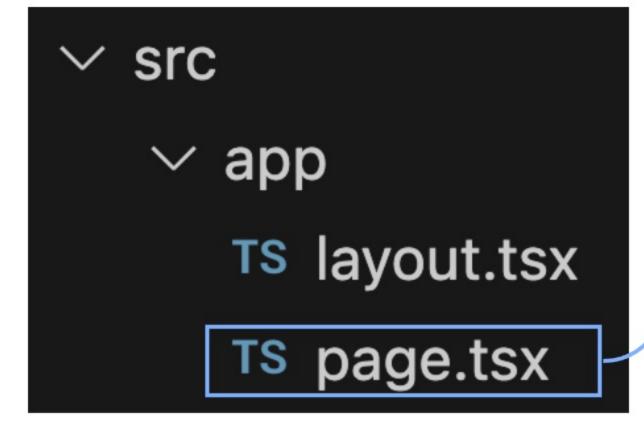

Each page has identical content at the top - place that content in the **layout.tsx** file!

The 'page.tsx' file in the 'app' folder is our root route

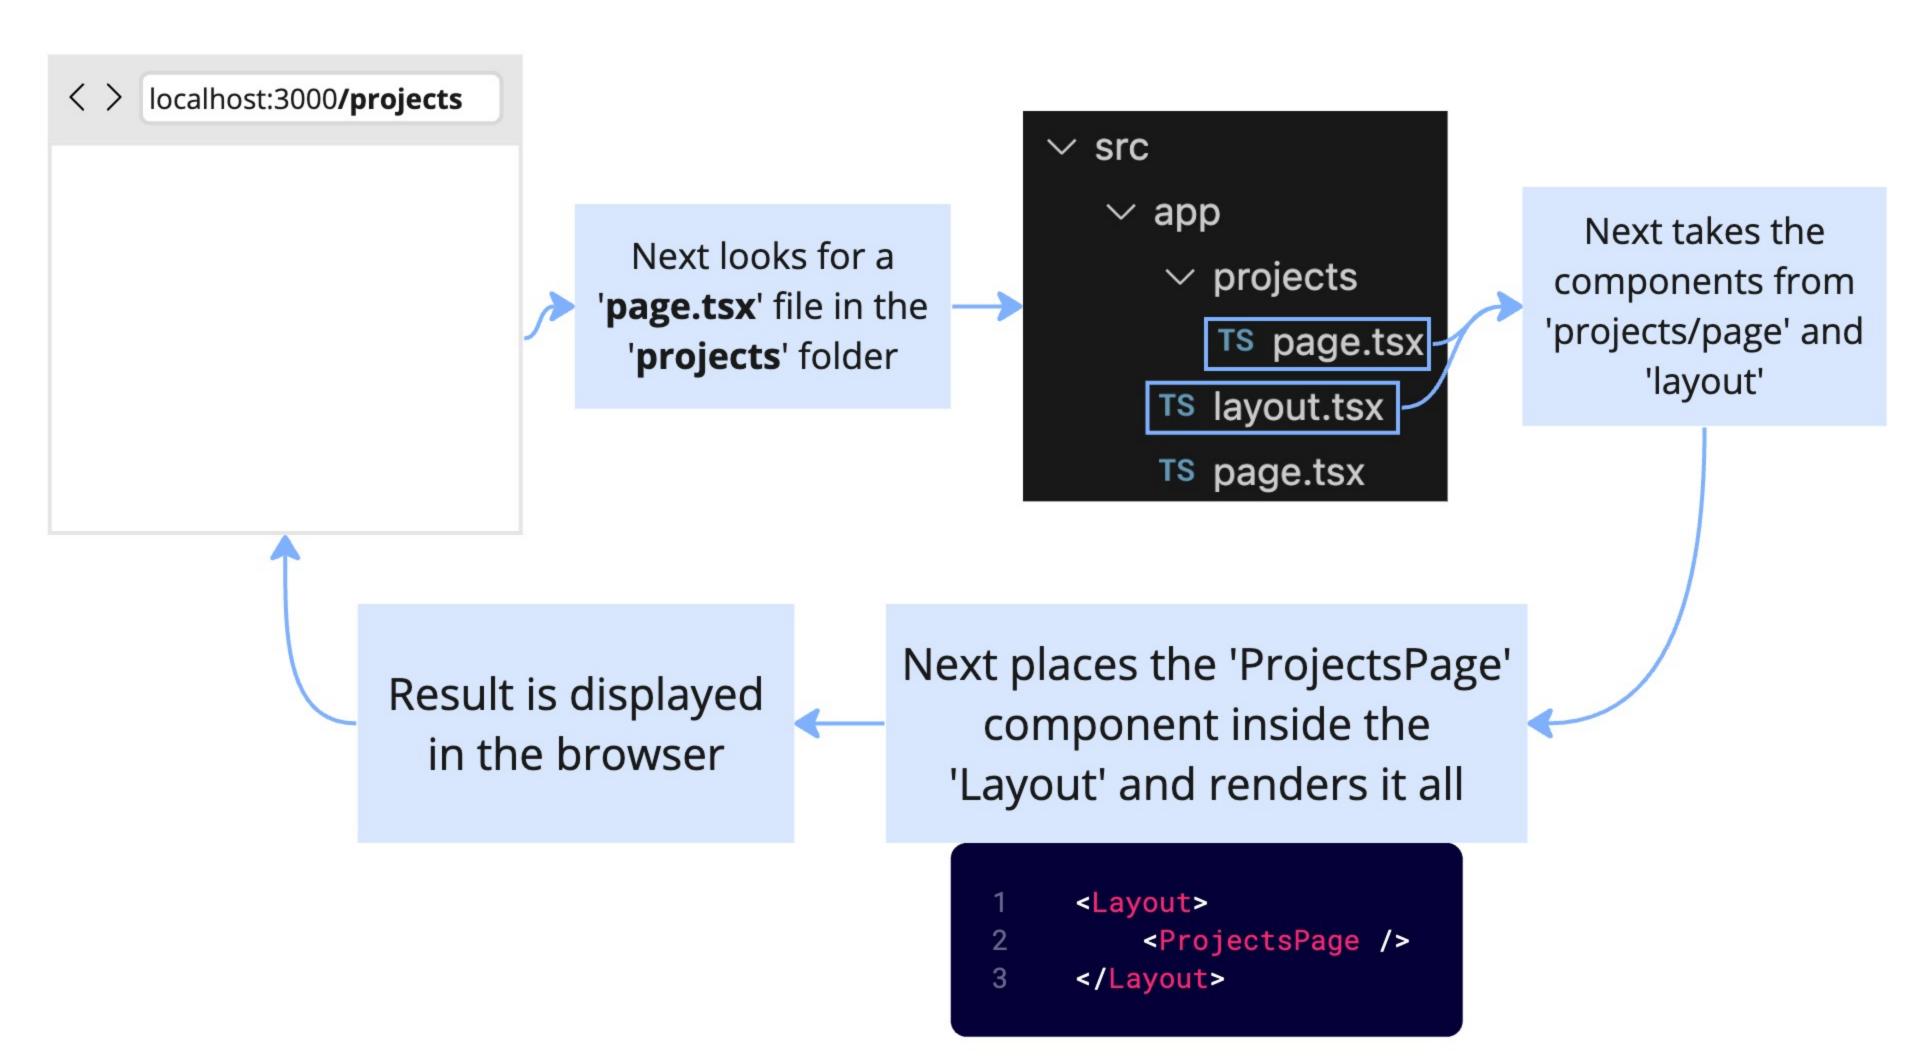

It gets displayed when a user goes to 'localhost:3000'

localhost:3000/projects

List of projects

#### New Route!

When a user goes to localhost:3000/projects
Show some text on the screen

localhost:3000/tasks

List of tasks

### **Exercise!**

When a user goes to

localhost:3000/tasks

Show the text "List of tasks"
